

Fig. 2: Numbers of spectroscopic redshifts available in GAMA, VIPERS and SDSS-BOSS, vs. the number that were used in the KiDS-450 CC calibration of Hildebrandt et al. (2017). GAMA and SDSS overlap with KiDS and will be used at $z < 0.7$; with the proposed KiDS/VIKING-like imaging of the VIPERS area we will be able to do the same at higher redshift.
